

Cross Pollinating Arabidopsis

Cross Pollinating Arabidopsis (continued)

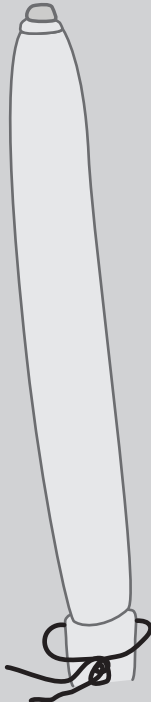

Flower
Chosen to be
Ovule Donor

Cross pollinate by dabbing the anthers of your pollen donor on the stigma of your ovule donor. Repeat for many flowers. Success rates for beginners are 1/10.

If the flower
is pollinated, it
will start
growing into a
silique within
a few days.

Wait for the silique
to dry down before
harvesting seeds
(about 1 week)
